Quarterly Customer Operations Review - Q2 FY2026

Controlled synthetic document created for long-document summarization evaluation.

Executive Overview

During the second quarter, the customer operations division processed 48,620 service requests across email, web chat, and phone channels. Average first-response time improved from 5.4 hours in Q1 to 4.1 hours in Q2, while the proportion of tickets resolved within the internal 24-hour target increased from 71% to 79%. The improvement followed a revised triage workflow introduced on April 8 and a pilot automation rule that routed billing and account-access cases directly to specialized queues. Management noted that the gains were strongest in English-language requests, while Arabic requests still experienced uneven handling during peak periods.

Service Quality and Complaints

Customer complaints related to delayed responses decreased by 14% compared with the previous quarter. However, complaint volume related to repeated handoffs between teams increased by 9%. A manual review of 320 escalated cases found that 46 cases had been reassigned three or more times before resolution. The quality team recommended consolidating ownership rules for payment disputes, subscription cancellations, and identity-verification cases.

Decision Log

Management approved a six-week workflow redesign project beginning July 15. The project budget is capped at $68,000 and includes process mapping, queue-rule changes, and additional supervisor training. A separate proposal to purchase a new workforce-management platform for $145,000 has not yet received final budget approval. No vendor contract may be signed until the finance committee completes its review on August 22.

Page 2 - Staffing, Forecast, and Risks

Staffing and Capacity

The division ended the quarter with 84 full-time agents and 11 temporary agents. Eight new hires completed onboarding in June, but three experienced agents resigned during the same period. Weekend coverage remains the main capacity concern. Forecasting indicates that inbound volume may rise by 12% during the September product-renewal cycle if current marketing plans proceed unchanged.

Operational Risks

Two recurring risks were highlighted. First, the knowledge base contains 173 articles that have not been reviewed in more than 18 months, including 29 articles used frequently by Arabic-speaking agents. Second, the escalation mailbox still relies on manual prioritization, which creates inconsistent handling of urgent cases. The compliance team also found that 7 of 50 sampled case notes contained unnecessary personal information and requested a cleanup before the next audit.

Next Actions

The operations director required three actions before the next quarterly review: complete the workflow redesign pilot by August 30; update the highest-use Arabic knowledge articles by September 12; and reduce multi-handoff escalations by at least 20% relative to the Q2 baseline. The new workforce-management platform remains only a proposal. The team will present an updated cost-benefit analysis before any purchasing decision is made.
